Pro Net is a website devoted to computer technology in general. A daily news source and blog for people who work with tech and those who want to know tech.

News and events are covered with perspectives on technology, innovations and consumer technology. Q: How to handle a typedef struct I am using a typedef struct for practice. The line below does not seem to work for me. typedef struct { int id; int value; } cpuStructure; It seems to say the name of the struct is "struct" error: expected identifier before numeric constant I have also tried to use #define but I get the same error. I can not find this error in other place of my code and I have not tried to handle struct from another file. How do I solve this problem? Thank you in advance for your help. A: A typedef in C has no meaning, so the identifier struct is not used as a keyword. You must type out the struct. Q: How to perform a WHERE query using data from a PHP array I have the following post request to an API from PHP: \$requests = array("api_id" => "param1", "api_name" => "param2", "data" => array('id' => \$id, 'name' => \$name, 'email' => \$email,)); I have an associative array and I'm trying to retrieve data using the \$id, \$name, \$email variables from the data array. I know the following works: \$requests = array("api_id" => "param1", "api_name" => "param2",); \$id = \$api_name = \$name = \$email = 0; if (array_key_exists("api_id", \$requests)) {
