The application offers you the chance to filter out only the specific frame you want (disabled by default).The present invention relates generally to rotary actuators and more particularly to a method and apparatus for generating a controlled air bearing. A typical universal joint allows pivoting of one shaft with respect to another at a constant, preselected angle, without relative axial movement. Universal joints are commonly used to transfer power from a power source to a driven element, such as an axle or propeller shaft, in a transmission. Common types of universal joints include the fixed-hinge, semi-floating-hinge and Cardan joints. Many of these joints employ bearings that support the joint for relative rotation. The bearing surfaces of the bearings in universal joints may be subjected to high temperatures, high load, vibrations and moisture. Air and grease are the lubricants typically used to make the bearings operate effectively at high temperatures. However, the air that is used to perform the bearing functions is sometimes expelled from the bearing. When the bearing is fully loaded, the expelled air may be a fluid with a specific viscosity that is very effective at sealing and lubricating the bearing surfaces, while also providing the bearing with rigidity. This expelled air, however, during the design phase for many universal joints, is stored under the bearing surfaces. A universal joint designed with air stored under the bearing surfaces has good sealing during the early stages of use of the universal joint, but the seal is open during the latter stages. The displacement of the air (or the expulsion of the air) changes the physical characteristics of the joint, especially the stiffness of the joint. The stiffness of a joint is a very important performance measurement of a universal joint. Some applications require a universal joint with very high stiffness. The combined effect of the change in stiffness and seal characteristics can ultimately result in a universal joint that has an inconsistent stiffness and an inconsistent seal. A bearing may be designed with a rigid bearing surface, but this rigid bearing surface can have poor sealing during the use of the universal joint. A device known as a controlled air bearing (CAB) is a bearing design that allows the construction 09e8f5149f
