Heterogeneity in the production of interferon-alpha in human myeloid and non-myeloid cell lines. Forty-eight cell lines produced in various kinds of culture and incubated with several kinds of stimulation and fixation conditions were evaluated for production of interferon-alpha by a micro-neutralization assay. Production of interferon-alpha was observed in 14 cell lines among the myeloid-derived cell lines and 7 cell lines among non-myeloid-derived cell lines. We investigated the biochemical characteristics of interferon-alpha produced in all cell lines. In the myeloid cell lines, most interferon-alpha produced was characterized as a molecule with a molecular weight of 19,000 daltons, whereas in the non-myeloid cell lines a broad spectrum of molecular weights, from 19,000 daltons to 22,000 daltons, was observed. These results suggested that the production of interferon-alpha is heterogeneous and that some mechanisms or cell types may exist to enhance this production.

Q: Like operator inside Where Clause
Why this query not work
string searchText = "test"; var results = db.Table.Where(i => i.Name.ToLower().Contains(searchText) || i.City.ToLower().Contains(searchText) || i.Country.ToLower().Contains(searchText)) .ToList();
But if I write like this, it works.
string searchText = "test"; var results = db.Table.Where(i => i.Name.ToLower().Contains(searchText) || i.City.ToLower().Contains(searchText) || i.Country.ToLower().Contains(searchText)) .ToList();
I have to use || in where clause.
A: The || works in your second example because you're narrowing the result set before executing the statement. The.ToLower() call is unnecessary as the LINQ provider will call it for you when necessary. So, the second example gets translated to: db.Table.Where(i => i.Name.Contains(searchText) || i

Hyaluronic acid as a novel promising scaffold for skin tissue engineering. Since Nov. 3, 2013, U.S. Food and Drug Administration approved the safety and efficacy of hyaluronic acid (HA) as the first synthetic biocompatible and biodegradable HA-based biomaterial. The literature review suggests that HA biomaterial holds great potential for skin tissue engineering. In this review, the relevant physical and chemical properties of HA are summarized. Moreover, a number of biological and clinical applications of HA-based biomaterials as a scaffold for skin tissue engineering are discussed, with an emphasis on skin wound repair. Finally, the author proposes that the combined HA and dermis models might provide a comprehensive perspective in tissue regeneration.

Perfectionism and alcohol use behaviors of college students. To date, the use of problem-focused research methods to study perfectionism among college students is new. This study examined the relationships among a comprehensive array of alcohol use behaviors, including frequency of drinking alcohol, sex of alcohol drinker, number of drinks consumed, frequency of heavy drinking, and number of alcohol-related problems experienced, and perfectionism. Participants were 198 college students. Each male participant had a male partner, and each female student had a female partner. Participants completed measures of perfectionism (Multidimensional Perfectionism Schedule) and alcohol use behaviors. Significant, positive relationships were found between total perfectionism score and sex of alcohol drinker. Men drank more frequently and had higher levels of alcohol-related problems than women. Perfectionism was positively related to the number of drinks consumed by both men and women, and positively related to the number of alcohol-related problems experienced. Given the high prevalence of alcohol use behaviors among college students, further
