Download : PC Fix, Microsoft Updates, Game Fix KMS Client Emulator v1.0 - For Increasing KMS Server Client CountSeahorse A seahorse (Neopetrosina) is a genus of the family Syngnathidae, formerly known as the vestimental gnathostomes. They are known from the Oligocene to the Holocene and primarily the tropical western Atlantic Ocean, with two described species from Japan. As no material is known for almost 20% of the species within the genus, they could potentially be significantly more species-rich. Description All seahorses are generally long and slender, with a small head and a large, thin beak. They have two dorsal fins; a dorsal and a caudal fin; a peritoneal membrane (which is fish-like) and a rudder (which is flat), which are used for swimming. Their ventral fins are not used for locomotion. The body has 13 to 15 fin rays on the dorsal, the caudal fin and on the anal fin. They are pelagic species, spending most of their time in the open ocean, rarely coming into the shallow coastal water. They are also hermaphrodites. This means that, like other fish, they are produced sexually mature before they are born. They make different sex-cord structures before they are born. Some of the structures can be found in the ovary or in the testes; others are made inside the egg. This means that there are two sexual organs within the same individual. Diet The feeding habits of seahorses are still not fully understood. However, one analysis of the species within the genus Neopetrosina (and also within Plectronocetus, Chrysomelon and Chaunax) shows that the diet is not as diverse as it is within some other fish groups. The diet mainly consists of the tissues and organs, including the skin and some parts of the internal organs, of other fishes. They do not, for example, eat algae, which they do not have the ability to eat. They do, however, consume other animals. In fact, they eat some of the same animals as ray-finned fish: other teleosts, which they catch as prey. Distribution Seahorses are mainly tropical marine animals. The currently known species have been found from the southern Oligocene to the Holocene of the tropical western
