- the electrical distribution system can be modeled from the electrical project using a graphical modeling tool. it allows us to create the electric distribution system with all the new features in revit. revit 2019 adds several new features to the revit build 2017.1 release notes for revit architecture. revit 2019 expands the capabilities for electrical design by adding the ability to analyze the electrical design using the following new features: when you create a structure in revit, you can now add components to the structure by right-clicking on the structure, the component, or the subcomponent. the new electrical power command in the project panel allows you to select a single power component and create a dedicated power annotation. with this command, you can, for example, create a power annotation for a single panel, like a single piece of equipment. the electrical distribution system in revit 2020 can now be created for each building footprint using the building footprint plugin. this enables designers to model the distribution system in a way that is more accurate, complete, and consistent. with the revit 2020 electrical project type, you can create a complete electrical project that covers power distribution, building footprints, and related details such as lighting controls, phone jacks, and other relevant information. this project type is a great option for managing your electrical design documentation, especially in large projects. the new version of the revit software will be implemented in the following categories: advanced design architectural design civil engineering industrial engineering mechatronics engineering mechanical design nde power & energy resource & materials management structural design surveying
