Back in the day, I went through a couple of phases where I used Lightroom and then switched to Photoshop, registering for both. When Lightroom began to stagnate, I settled into using Photoshop (though I never went completely back to Lightroom because it wasn't relevant enough for what I mostly do now). When I first saw the Lightroom community, I thought it was a troll campaign of some kind. Lightroom is fine, though I live in a country where it has to be the latest release in order to be widely relevant, and it's good that it's kept up by Adobe's huge engineering and QA resources. If you already run Photoshop, there are limited reasons to switch over to Lightroom 5. However, if you're going to be a Lightroom user, you'll want the most current version (which is 2019 at the time of this writing). If you're just looking for the best image-editing software, Photoshop is for you. It's also a great tool for video editors and animation artists, and for anyone who is interested in making 3-D images. All of the same features are there as a standalone program, yet those who maintain an artistic eye tend to find the software to be a joy to work with. The only con that I can see being an issue is if you are going to be doing on-line photo sharing. Photoshop does not have the same privacy settings that Lightroom has, and it would be trivial to expose the information you are sharing through the use of the program. If you're looking for an on-line image editor, then both Lightroom and Photoshop are perfect. Like Lightroom, Photoshop lacks in some features, but the addition of AI features, features for 3-D, and the ability to run offline (as well as online) make it an extremely powerful image-manipulating tool.
