When file sharing software companies include their beta testers in their beta test group, they give beta testers a free keygen that allows them to decode the software and crack it without paying for the software. Because of the legal ramifications of cracking software, software companies actually test their software before they release it. This is known as the beta test. Software companies also provide beta versions of their software to a subset of its users, referred to as beta testers. When beta testers encounter a problem with a particular software, the software company will work with them to fix the bug. In return, the software company will give the beta tester a beta version of the software that is later released as the official version. Beta testers are typically the first to use a new software and provide the beta tester's feedback to the software company. Beta testers are very important to software companies because they often help the software company identify and fix bugs before the software is released to the public. Everybody wins: the software company is satisfied that their software is bug free, and the beta tester receives a free copy of the software.
